

Do you have a hole in your ear drum?

A hole in the ear drum can result from infection, trauma or problems with pressure equalization. Most holes heal on their own, but some do not. In these cases, the only currently available treatment is a surgical procedure.

Breathe Clear Institute is conducting a clinical trial using a non-surgical investigational treatment for people with a hole in the ear drum.

Qualified participants will receive study-related procedures at no cost. Participants may receive reimbursement for study-related travel.
